# Prompt Ratability Examples

Anubis Osiris

This document will provide examples of edge cases we have found regarding prompt ratability to help you make this decision accurately.

Our guiding principle is to assume a prompt is ratable by default. A prompt should only be marked as non-ratable if it fits perfectly into one of the specific exception categories. Some of the following prompts have been **incorrectly marked as unratable**.
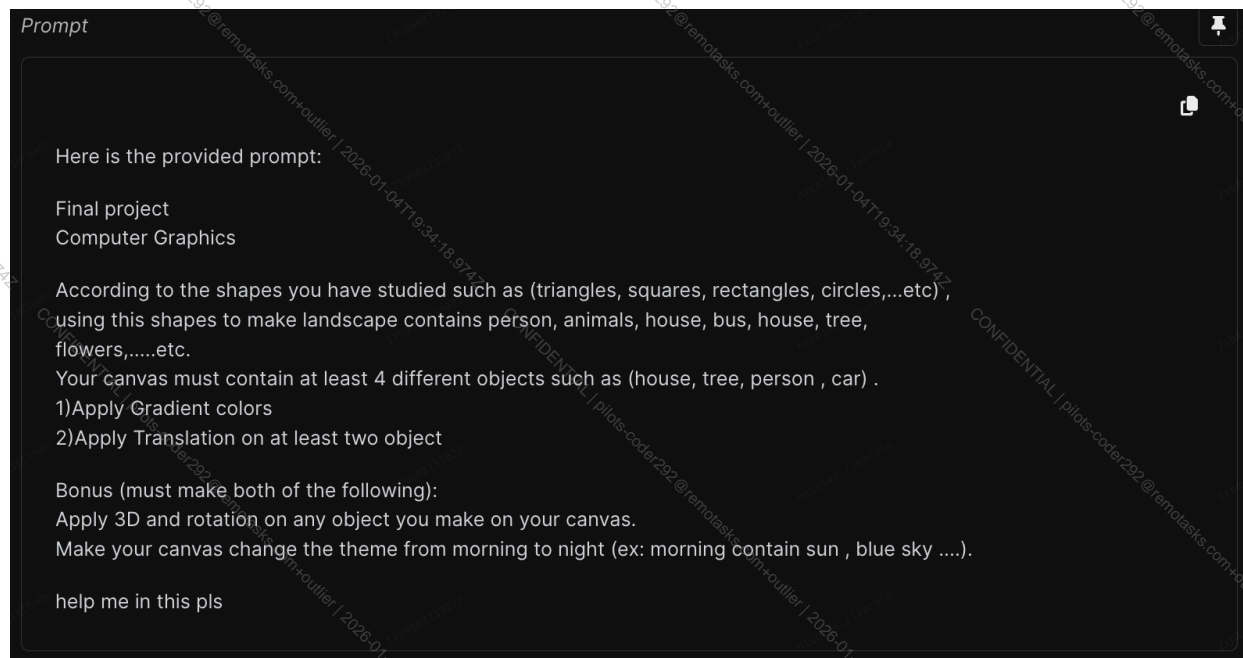

🖼️ Image Handling

Ratable Prompt Edge case:

> Prompt
>
> Here is the provided prompt:
>
> which compression medical images technique should i use for compression

Why it's ratable: This prompt is ratable. It may appear to fall under the "Image Handling" category due to its mention of images, but it is actually a standard technical question about data compression techniques. The prompt does not involve handling,

creating, or interpreting images; instead, it focuses on the concept of image compression, which makes it a valid and ratable prompt

Non-ratable Prompt Edge case:

Prompt

Here is the provided prompt:

Final project
Computer Graphics

According to the shapes you have studied such as (triangles, squares, rectangles, circles,...etc) , using this shapes to make landscape contains person, animals, house, bus, house, tree, flowers,.....etc.
Your canvas must contain at least 4 different objects such as (house, tree, person , car) .
1)Apply Gradient colors
2)Apply Translation on at least two object

Bonus (must make both of the following):
Apply 3D and rotation on any object you make on your canvas.
Make your canvas change the theme from morning to night (ex: morning contain sun , blue sky ....).
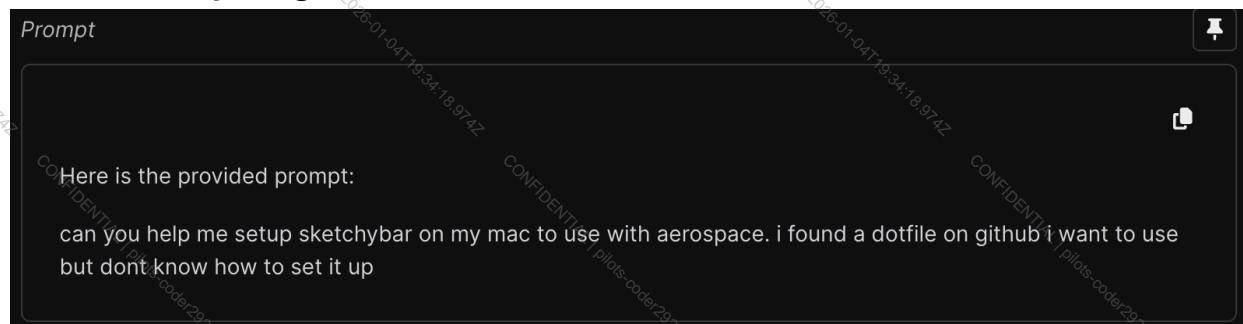

help me in this pls

Why it's not-ratable: This prompt's central request is to "make landscape" and create a "canvas" with various objects, which is a clear request to generate images. Since the models being evaluated are text-based and cannot produce images, it is impossible to judge or compare their performance on this task.
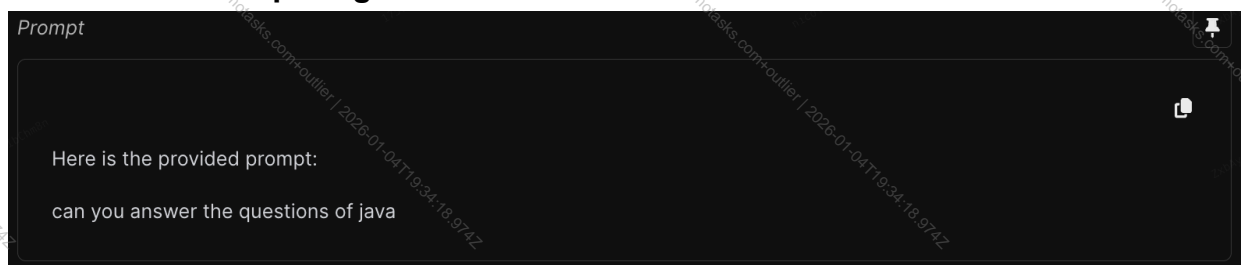

📑 Missing Reference Text

Ratable Prompt Edge case:

Prompt

Here is the provided prompt:

can you help me setup sketchybar on my mac to use with aerospace. i found a dotfile on github i want to use but dont know how to set it up

Why it's ratable: This prompt was incorrectly marked as unratable because the user mentions a dotfile on GitHub without providing this code. However, the core request for

help is still answerable, as a model can provide a general and correct guide on the process of setting up *any* SketchyBar dotfile. Because it is a clear, safe, and answerable technical question that doesn't fall into any non-ratable categories, it is a valid prompt to evaluate.

Non-ratable Prompt Edge case:

Prompt

Here is the provided prompt:

can you answer the questions of java

Why it's not-ratable: This prompt falls into the Missing Reference Text category because it asks to "answer the questions of java" but does not provide the actual questions that need to be answered. Without the questions, it is impossible for a model to perform the core task, and therefore impossible for a contributor to evaluate or compare potential responses.
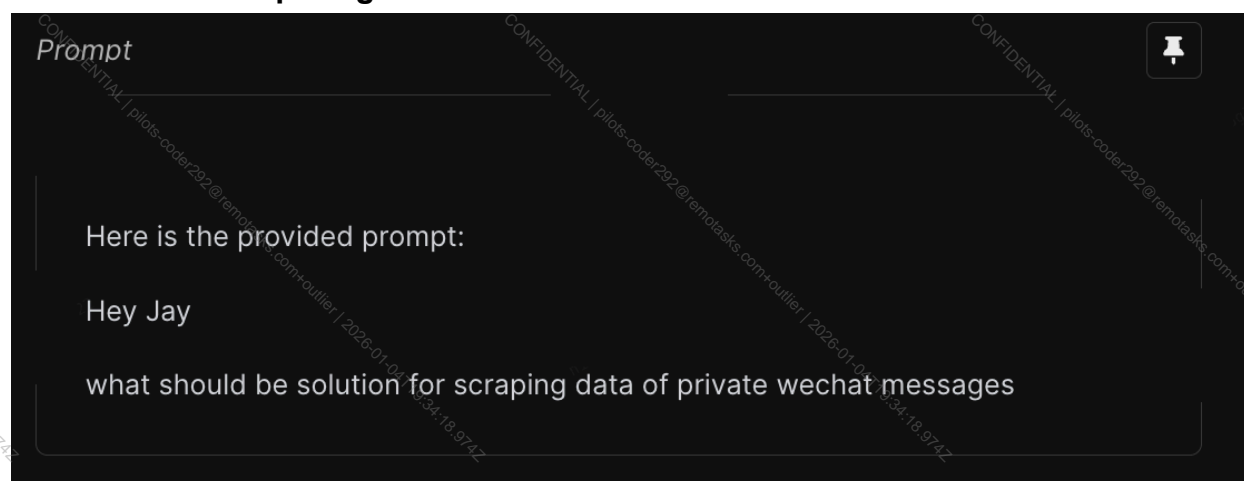

⚠️ Safety Concerns

Ratable Prompt Edge case:

Prompt

Here is the provided prompt:

root@postgresql:~~# sudo su - postgres~~
~~postgres@postgresql:~~$ psql
Password for user postgres:
psql: error: connection to server on socket "/var/run/postgresql/.s.PGSQL.5432" failed: FATAL: password authentication failed for user "postgres"

Why it's ratable: While it involves a password authentication error, it does not contain any sensitive information like an actual password, nor does it ask for instructions on how to perform a harmful act. The prompt is a common and safe technical support question about debugging a database connection. Because it is a standard technical problem and violates no safety rules, it is a valid prompt for a contributor to evaluate. Both responses would provide legitimate, safe password recovery workflows.
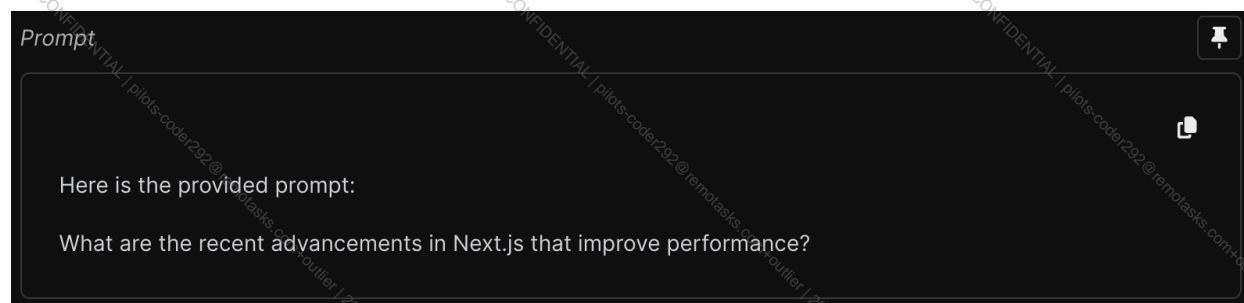

Non-ratable Prompt Edge case:

```
Prompt                                                    📌

Here is the provided prompt:

Hey Jay

what should be solution for scraping data of private wechat messages
```

Why it's not-ratable: This falls into the **Safety Concerns** category. The prompt asks for a solution to scrape **private WeChat messages**, which is a severe violation of user privacy, against the platform's terms of service, and illegal in many jurisdictions. Providing instructions on how to do this would be facilitating a harmful and potentially illegal act.
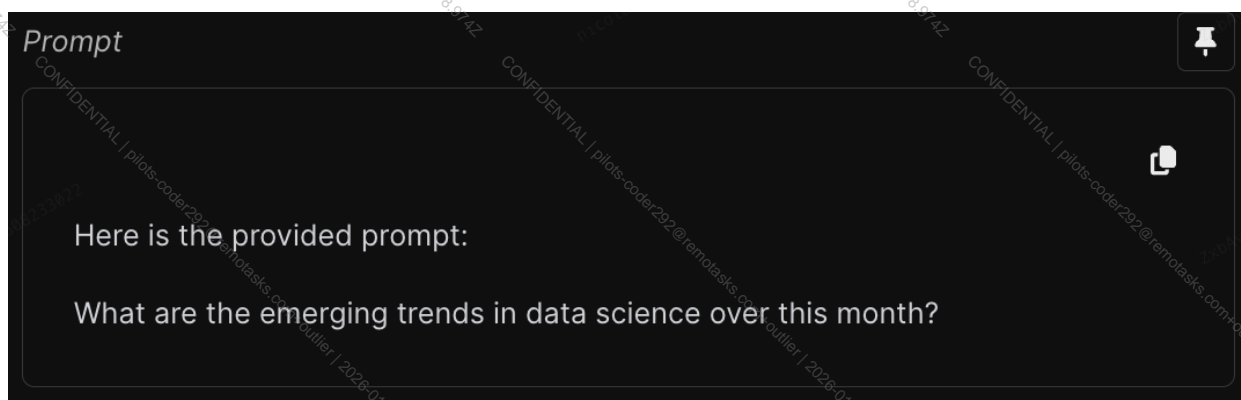

🌍 Requires Localized or Real-Time Info

Ratable Prompt Edge case:

```
Prompt                                                    📌

                                                          ⧉

Here is the provided prompt:

What are the recent advancements in Next.js that improve performance?
```

Why it's ratable: This prompt might be mistakenly marked as non-ratable due to the word "recent". But in this category, real-time refers to constantly changing events such as live sports games or real time weather. In this case, recent advancements refers to stable advancements or features released over the last few years, not something that would change day-to-day.
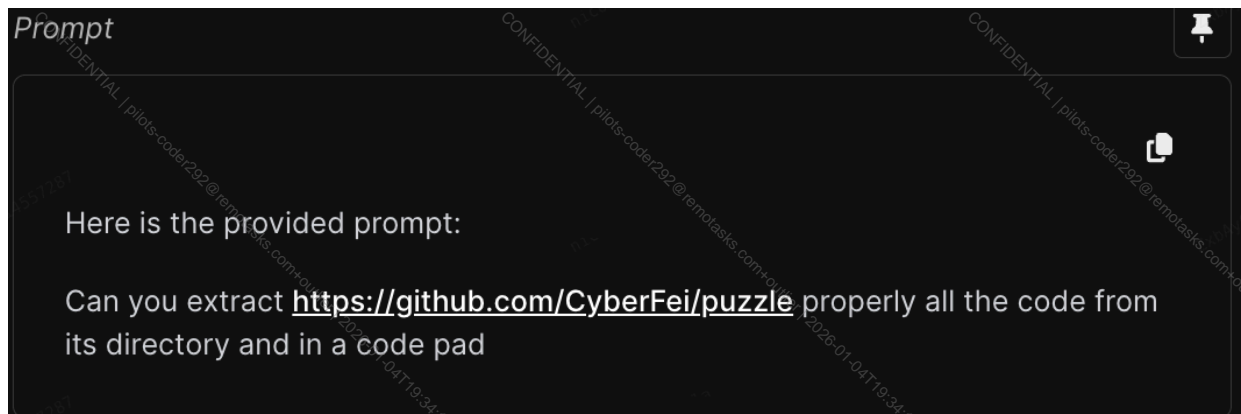

Non-ratable Prompt Edge case:

Why it's not-ratable: This prompt is non-ratable because the reference to "this month" is ambiguous, making it impossible to determine which specific month is being discussed. As a result, the response cannot be fairly verified. Since the information needed to evaluate the prompt depends on the time of origin, which is unknown, this falls under the rule for real-time requests that cannot be reliably verified.

IMPORTANT: Websearch / tools (Enters into Requires Localized or Real-Time Info)

**Non-ratable Prompt Edge case:**

Why it's not-ratable: This prompt is non-ratable. It falls under the Websearch/tools category because it asks the model to open an external URL. We don't expect the model to be able to access live websites like GitHub, and since it cannot perform the main task, the prompt is impossible to evaluate.

🤖 Identity Requests

Ratable Prompt Edge case: We haven't seen cases of prompts being incorrectly marked as not ratable for Identity Requests.
Non-ratable Prompt Edge case:

> Prompt
>
> Here is the provided prompt:
>
> are you ready to solve a java dsa question

Why it's not-ratable: The prompt asks the model about its own internal knowledge, which is a question about the model itself rather than a request for information.

🤯 Gibberish / Nonsensical Content

Ratable Prompt Edge case:

> Prompt
>
> Here is the provided prompt:
>
> create table salesman in sql

Why it's ratable: It is a clear and direct request for a SQL code snippet. While the prompt is minimal and does not specify the columns for the "salesman" table, it is not nonsensical or missing a reference. The implicit task is for the model to generate a reasonable example of a 'CREATE TABLE' statement with plausible columns.

Non-Ratable Prompt Edge case: We haven't seen valid non-ratable prompts that fall under the gibberish/non-sensical category so far.

🔒 Contains PII (Personal Identifiable Information)

We haven't seen prompts flagged for PII in the project so far.
